**wttr.py**  
*Release 1.0.0*

**Jul 16, 2020**

---

## Getting started:

---

<b>1</b>	<b>0. Getting started with wttr.py</b>	<b>3</b>
<b>2</b>	<b>1. CLI tool usage</b>	<b>5</b>
2.1	1.1. CLI arguments . . . . .	5
<b>3</b>	<b>wttr.py API documentation</b>	<b>11</b>
	<b>Index</b>	<b>13</b>

wtrr.py is a Python package that shows you forecast using wtrr.in.

## 0. Getting started with wttr.py

**Warning:** This tutorial assumes that you have installed at least Python 3.5 with pip.

You can install wttrpy package like that:

```
$ python -m pip install wttrpy --user
```

Now you can test it out:

```
$ python
>>> import wttrpy
>>> wttr = wttrpy.getWttr("Amsterdam", "en")
>>> print(wttr)
```

The output should be something like this:

```

Weather report: Amsterdam

\ /      Partly cloudy
- /" ".-. 17 °C
\_( ) .   17 km/h
/(__(_)   10 km
          0.2 mm

Tue 14 Jul
Morning      Noon      Evening
Night
Light rain sho... Patchy rain po... \ /
Partly cloudy | \ / Partly cloudy | - /" ".-. 15..17
, \_( ) .   17 °C | , \_( ) .   16 °C | - /" ".-.
°C | - /" ".-. 14 °C |

```

# CHAPTER 2

---

## 1. CLI tool usage

---

Since 1.1.0-beta.0 (1.1.0b0) there's a CLI tool available as a beta feature.

Here's how you can call it:

```
$ python -m wttrpy
```

The CLI tool is a “wrapper” for the `wttrpy` module that you can import:

```
#!/usr/bin/env python3
import wttrpy
```

If you call the CLI tool without any options, it will send a GET request to `https://wttr.in/`, but `wttr.in` will auto-detect your location depending on your IP address, but locale will still be English.

## 2.1 1.1. CLI arguments

### 2.1.1 1.1.1. Optional arguments `-h` and `--help`

`-h` or `--help` will print auto-generated help message by `argparse`.

```
$ python -m wttrpy -h
usage: __main__.py [-h] [--location LOCATION] [--locale LOCALE]

optional arguments:
  -h, --help            show this help message and exit
  --location LOCATION, -w LOCATION
                        Set location
  --locale LOCALE, -l LOCALE
                        Set locale

$ python -m wttrpy --help
usage: __main__.py [-h] [--location LOCATION] [--locale LOCALE]
```

(continues on next page)

(continued from previous page)

```
optional arguments:
  -h, --help            show this help message and exit
  --location LOCATION, -w LOCATION
                        Set location
  --locale LOCALE, -l LOCALE
                        Set locale
```

### 2.1.2 1.1.2. Optional arguments `-w` and `--location`

These arguments are used to change the location of the forecast.

`-w` and `--location` should have a value.

`-w` and `--location` can be values, that you can pass to API function `getWttr` (see API docs) as a first parameter (where)

```

$ python -m wttpry -w Amsterdam
Weather report: Amsterdam

### wtr.py API documentation

---

**getWtr** (`[where=None[, loc="en"]]`)

A function that returns a string with wtr.in's response.

`where` is `None` or a string that contains city name, (ex. `paris`) any location, (+ for spaces, ex. `~Eiffel+tower`) Unicode name of any location in any language, (ex. ) airport code, (3 letters, ex. `muc`) domain name, (ex. `@stackoverflow.com`) area codes (ex. `94107`) or GPS coordinates (ex. `-78.46, 106.79`)

If `where` is not given or `None`, then location will be auto-detected by wtr.in depending on your IP.

`loc` is the language code (ex. `en`, `fr`. Look for the full list of supported languages [here](#)) that you want wtr.in respond in.

CLI is in beta since 1.1.0-beta.0.

## G

`getWttr()` (*built-in function*), [11](#)
